

GIGA CHAT

A WhatsApp-native customer support assistant for Tricog Health India

Built to answer before we're asked

THE PROBLEM

Every support query is handled by a human, one at a time

The last twelve months of Zoho Desk tickets — 85,308 in total — absorbed manually by a team of fewer than ten.

7,109

support tickets every month

323

tickets every working day

711+

tickets per agent, every month

What that actually costs us

1 Agents repeat the same fixes daily

A loose lead cable or a wrong SIM is explained by voice, hundreds of times a month.

2 Support runs on office hours

A centre that hits an error at 9pm waits until morning to get moving.

3 Every ticket starts from zero

The agent must first establish which machine, which error, which centre.

89% of that volume falls into just four families of problem

Mapping all 156 issue types onto our support guides shows the queue is far more repetitive than it looks.

42%

of all tickets are hardware or app issues — the ones a customer can genuinely fix themselves with the right instructions

2,994

of those land every month (35,923 across the year) — each one an agent explaining a fix that could have been a menu tap

All 156 issue types were mapped to the four categories using our internal support guides; a small number are judgement calls.

Our support desk, on the app customers already have open

A guided WhatsApp assistant that resolves what it can, and escalates what it can't — with the paperwork already done.

Guided, not chatty

The customer never has to describe a problem in words. Four taps takes them from "something is wrong" to a specific fix.

Illustrated fixes

Each answer arrives as a clean instruction card written in plain language, not a wall of text.

Always available

Works at 2am, on a weekend, from a rural centre — with no app to install and no login to remember.

Escalates cleanly

"Still not working" creates a fully classified Zoho Desk ticket and hands over to a human.

Why WhatsApp, and not a portal or an app

Zero adoption cost. Our customers are technicians and front-desk staff at diagnostic centres, not IT users. They already live in WhatsApp — nothing to download, no credentials to issue, no training required. A single QR code or link is the entire onboarding, and the conversation history stays in their own chat list for reference.

From "something is wrong" to a resolution in four taps

Then one question decides everything: “Did this solve your problem?”

What the customer actually sees

1. Pick a category

Four plain options. No typing, no jargon, no wrong answers.

2. Narrow it down

Every option carries a one-line description, so a user who doesn't know their device model still picks correctly.

3. Get the fix, confirm it

The instruction card arrives, then the bot asks whether it worked — and acts on the answer.

Five scattered guides, one structured knowledge base

5

internal guides consolidated

93

individual issues documented

5

device families covered

16

linked bot flows built

Every issue carries a triage tag, which is what makes automatic routing possible

 You can fix this

Self-serve. The bot delivers the steps and closes the conversation if they work. No ticket, no agent.

Ticket priority: Low

 We're on it

Needs the team, but no conversation. The bot collects the details and raises the ticket.

Ticket priority: Medium

 Talk to us

Clinical, commercial or sensitive. The bot never attempts an answer — it escalates immediately.

Ticket priority: High

How a WhatsApp message becomes a Zoho Desk ticket

Built and proven end to end — tickets are already being created automatically from live conversations.

Proven, not theoretical

Live tickets #DH-133955 through #DH-133957 were created by real WhatsApp conversations, complete with category, sub-category, exact issue and priority. The integration is working today, not planned.

One deliberate limitation

Because a number can only live on one platform, the live chat sits in WATI's Team Inbox and Zoho Desk receives the ticket. Full two-way reply sync — agents answering from Zoho Desk directly — is the next phase, not today.

Built and working, with a clear path to production

Done

- 93 issues rewritten as customer-facing fix cards
- 16 linked WATI flows covering all four categories
- Company WhatsApp number connected and live
- Meta business verification and app review cleared
- Zoho Desk API integration built and proven end to end
- Tickets auto-created with full classification and priority
- QR code and deep link for customer onboarding
- External user testing completed

To go live

- 1 Repoint tickets to the real support department**
Currently landing in the project test desk
- 2 Move WATI from trial to a production licence**
Needed before real customer volume
- 3 Complete the DIY video library**
Tracker is already with the hardware and software teams
- 4 Add two-way reply sync into Zoho Desk**
So agents can answer without opening WATI
- 5 Name a content owner in the support team**
Fix cards need upkeep as devices change

What could go wrong, and what we've already done about it

The bot gives clinical advice

Every report and diagnosis path is tagged escalate-only. The bot is structurally incapable of interpreting an ECG — it collects details and hands to the medical team.

A customer hits a dead end

Every branch terminates in either a confirmed fix or a human handoff, with the support email and helpline on every fallback.

Wrong tickets during rollout

Tickets currently route to a test department by design. Repointing to the live queue is a single configuration change, made deliberately at go-live.

Content goes stale

The knowledge base is one structured source feeding the bot. A named owner in the support team keeps it current as devices change.

Four decisions to take this from working to production

1

Approve go-live

Point the bot at the live Customer Support department and open it to real customers.

2

Approve the WATI licence

Move off the trial onto a production plan sized for our ticket volume.

3

Assign a content owner

One person in the support team to keep the 93 fix cards current.

4

Unblock the DIY videos

Ask the hardware and software teams to complete the video tracker already circulated.

The knowledge base, the flows and the integration already exist and work. What's left is permission and a licence — not development.

Thank you

Questions, and a live walkthrough of the flow builder or Zoho Desk on request.

support@tricog.com • +91 80 4075 3333 • Bot: +91 72043 86787

One in every nine tickets tells us nothing at all

9,125

tickets a year • about 760 every month • 10.7% of everything logged

Duplicate Ticket	5,123
Junk mail — not a relevant query	1,814
Unspecified	1,222
No Reason	959
Junk	7

Why a menu-driven bot fixes this by design

- 1

Nothing is free-typed

The customer picks from a list, so category, sub-category and issue are captured as data — never as a vague sentence an agent has to interpret.
- 2

The ticket arrives labelled

Priority, device and exact error are already on the ticket the moment it lands in Zoho Desk.
- 3

Only unresolved cases become tickets

If the bot's fix works, no ticket is created at all — which removes a large share of the duplicates.

The fix card is where this project lives or dies

Our internal guides were written for engineers. Every one of the 93 issues was rewritten for a stressed technician on a small screen.

3.1 ECG machine not powering on

• Quick Fix

What you will notice: The machine does not switch on when you try to use it.

How to fix it

1. Press the power button and check if any light turns on.
2. If the battery light is flashing, the battery may be low. Plug the machine into a power socket and charge it.
3. Check if the battery is properly inserted. If needed, remove and put it back correctly.
4. You can also try using the machine directly with AC power (plugged into the wall).
5. If the machine still does not turn on or the battery is not charging, the battery may need to be replaced.

1

Written for the panicked, not the patient

Short numbered actions in the order you'd actually try them. No explanation of why — just what to do next.

2

Symptom first, diagnosis never

Each card opens with "What you will notice", because the customer knows what they can see, not what it's called.

3

Fits WhatsApp's real constraints

Menu rows cap at 24 characters and descriptions at 72, so every label was written to that limit rather than truncated into nonsense.

4

One escape hatch, always

Every card ends in a route to a human, so nobody is ever stuck at the bottom of a branch.

Six platforms were evaluated before a line was built

Platform	What it offered	Why it didn't fit	Verdict
SendPulse	Genuinely free tier, visual builder	Vendor branding on messages; weak WhatsApp list support	No
AiSensy	India-based, INR billing, free plan	Chatbot flows are a paid add-on — the free plan can't build a bot	No
Fastbots.ai	AI trained on our own guides	No button or decision-tree flows at all — wrong shape entirely	No
Brevo	Unified inbox, AI chatbot	Built for free-text answers, not fixed menus; no Zoho Desk path	No
Zoho SalesIQ	Native to the Zoho stack	Taking the number into Zoho's own channel would have blocked the bot builder we needed	No
WATI	Meta-approved BSP, drag-and-drop builder, native WhatsApp lists, flow import/export, webhook nodes	Paid platform — the trade-off we accepted	Chosen

The constraint that drove the whole architecture: a WhatsApp number can only be connected to one platform at a time. WATI holds the number and runs the bot; Zoho Desk receives tickets through its API instead of owning the channel.

The router: one main menu, sixteen linked flows

WhatsApp caps how large a single flow can be, so the bot was built as a router that hands off to a specialist flow per device and topic.

Four categories

Hardware, app, report, billing — mirroring how customers describe problems, not how we organise teams.

Descriptions on every row

"GE Healthcare 12-lead ECG machine with display and printer" tells a user which device they own.

Sixteen trigger nodes

Each hands off to a dedicated flow, keeping every individual bot small enough to run reliably.

Inside a single flow: every branch ends in a fix or a ticket

What each flow contains

- Issue list**
 The errors for that one device, in the customer's language.
- Fix cards**
 An illustrated card per issue, sent as an image.
- The confirm step**
 "Did this solve your problem?" — the branch point.
- Webhook pair**
 One call refreshes the Zoho token, the second creates the ticket.
- Human fallback**
 An explicit route to the support team on every path.

The MAC600 flow — one of sixteen

What a lead cable fault looks like, before and after

TODAY

- 1 Centre calls the helpline during office hours, or emails and waits.
- 2 Agent answers, then spends minutes establishing the centre, machine and symptom.
- 3 Agent talks them through the fix verbally, from memory or a document.
- 4 Agent logs a ticket afterwards — sometimes vaguely, sometimes not at all.
- 5 The same call happens again next week, from a different centre.

WITH GIGA CHAT

- 1 Centre opens WhatsApp at any hour and taps four options.
- 2 The illustrated fix card arrives in seconds, in plain language.
- 3 Most cases end here — resolved, with no agent involved and no ticket raised.
- 4 If it doesn't work, a fully classified ticket reaches the right queue instantly.
- 5 The agent starts already knowing the device, the error and what's been tried.
